                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of AEB56762 to AEB5671; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of AEB56764 to AEB56771 and (b) detecting the amplified target sequence. (I); (MI) and (MI) are useful for detecting enterovirus target sequence. (I); (MI) and (MI) are useful for detecting enterovirus target sequences. (I); (MI) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of AEB56762 to AEB56771; and (b) a sequence required for selected amplification or detection. Also described: (1) a kit (XI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of AEB56764 to AEB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (MI) are useful for detecting enterovirus target sequences. (I), (MI) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.

```

```
Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
Consensus viral 5' untranslated polynucleotide sequence.
                                                   DNA detection; enteroviral detection; da

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABBS6712 to ABBS6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (K1) comprising (I), and one or more container that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS6764 consisting essentially of target binding sequence of any one of ABBS6764 (X1) are useful for detecting the amplified target sequence. (I), (M1) and (K1) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The presents sequence repeace a viral 5°, untranslated polymorlectide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABS5672 to ABS5671; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABS56764 to ABS5671 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (XI) are useful for detecting encerovirus target sequence. (I) specifically and selectively recognizes the enterovirus genome. (I) specifically and rapidly detects fewer than 500 copies of entercoviral sensitively and rapidly detects fewer than 500 copies of entercoviral present sequence represents a consensus viral 5' untranslated polynucleotide sequence given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    дарв

The invention relates to an oligonucleotide (1) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the consequence of ABS677; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (1), and one or more container that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB5674 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1), (M1) and (K1) are useful for detecting enterovirus target sequence. (1), specifically and selectively recognizes the enterovirus genome. (1) specifically and rapidly detects fewer than 500 copies of enteroviral sensitively and rapidly detects fewer than 500 copies of enteroviral segmence represents a viral 5' untranslated polymucleotide present sequence represents a viral 5' untranslated polymucleotide sequence given in the exemplification of the present invention.
                                                                                   Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an oligonucleotide (I) consisting of: (a) the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABBS6712 to ABBS671; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (K1) comprising (I), and one or more container that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS674 to ABBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequences. (I), (M1) and (X1) are useful for detecting enterovirus target sequences. (I) specifically and selecting enterovirus target sequences. (I) specifically and selecting enterovirus target sequence. (I) specifically and rapidly detects fewer than 500 copies of enteroviral senome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5 untranslated polymucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                             Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of AEB56762 to AEB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (l) a kit (K1) comprising (l), and one or more containe that contains (l); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of AEB56764 to AEB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (l), (M1) and (K1) are useful for detecting enterovirus target sequences. (l), (M1) and

As sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (I), and one or more contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence to consisting essentially of target binding sequence of any one of ABB56774 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (M1) and
                                                                                                                                                                                                      specifically and selectively recognizes the enterovirus general sensitively and rapidly detects fewer than 500 copies of enteroviral generatively and rapidly detects fewer than 500 copies of enteroviral senseme and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              oligonucleotide comprising sequences for binding and amplifying or

Also described: (1) a kil (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ARB56774 to ARB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (KI) are useful for detecting enterovirus target sequences. (I), (MI) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           d range of enterovirus serotypes. The 5' untranslated polynucleotide
                specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        specifically and selectively recognizes the enterovirus genome. Also described: (1) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification fraction; and (b) detecting the amplified target sequence. (I), (MI) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polymuclectide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         invention relates to an oligonucleotide (I) consisting of: (a) the

Also described: (1) a kit (K1) comprising (I), and one or more container that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS6764 to ABBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (M1) and (K1) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome. (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                         Š
                                                                                                                                                                                                                                                                       The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of AEBS6771 and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of AEBS6764 to AEBS671 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I) (MI) and (KI) are useful for detecting enterovirus target sequences. (I) sensitively and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enteroviral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                  Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

```
The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the consisting sequence of ABBS6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS674 to ABBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (KI) are useful for detecting enterovirus target sequence. (I) specifically and selectively recognizes the enterovirus genome. (I) specifically and rapidly detects fewer than 500 copies of enteroviral sensitively and rapidly detects fewer than 500 copies of enteroviral spenome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polymucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                 Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.

```
target binding sequence of an oligonucleotide chosen from any one of the losequence of AEB5672 to AEB5771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) and kit (X1) comprising (I), and one or more container that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of AEB5674 to AEB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1), (M1) and (X1) are useful for detecting enterovirus target sequences. (1) specifically and selectively recognizes the enterovirus genome. (1) sensitively and rapidity detects fewer than 500 copies of enteroviral senome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polymucleotide sequence given in the exemplification of the present invention.
Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                        The invention relates to an oligonucleotide (I) consisting of: (a) the

2005-512251/52 GENBANK; X04468 Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids. Disclosure; Fig 1A-D; 34pp; English.

The invention relates to an oligonuclectide (I) consisting of: (a) the target binding sequence of an oligonuclectide chosen from any one of the 10 sequence of AEB56762 to AEB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit

The invention relates to an oligonucleotide (1) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56762 to ABB5671; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (XI) comprising (1), and one or more container that contains (1); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB5671 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1), (MI) and (XI) are useful for detecting enterovirus target sequences. (1) specifically and selectively recognizes the enterovirus genome. (1) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The ö to ABB56771 and optionally a sequence required for selected amplification reaction, and (b) detecting the amplified target sequence. (I), (M1) and (K1) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of AEB56764 Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids. comprising (I), and one or more container that contains (I); and Gaps . 0 sequence given in the exemplification of the present invention Viral 5' untranslated polynucleotide sequence SEQ ID NO:43. 0; Indels Score 20; DB 14; Length Pred. This sequence represents domains II-VI of the internal ribosomal entry site (IRES) of wild-type poliovirus type 1 Mahoney. The invention provides non-pathogenic, oncolytic, recombinant polioviruses (I) in which the IRES of the wild-type poliovirus is exchanged with the IRES of another picornavirus, such as human rhinovirus type 2, and optionally the Pl, P3 or 3 untranslated region is exchanged with that of Sabin poliovirus. (I) may contain a composite IRES encompassing IRES domains from both wild-type poliovirus and from another virus. (I) are useful for treating malignant tumors such as glioblastoma multiforme, medulloblastoma, mammary, prostate, colorectal, hepatocellular, bronchial and epidermoid carcinomas (claimed).                                                                                                                            ö
expression unit in which a sequence responsible for internal translation start (designated "IRES") is located between cistrons coding for the PDGF-B and PDGF-A chains. The preferred IRES sequence for inclusion in the bicistronic construct is the 5. UTR from Poliovirus type 1 Mahoney strain of sequence AAQS8715. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Heterodimeric proteins can be recombinantly produced using a multicistronic (esp. bicistronic) expression unit in which a sequence responsible for internal translation start (designated "IRRS") is located between cistrons coding for the different subunits. The preferred IRRS sequence is the 5. UTR from Poliovirus type 1 Mahoney strain of sequence AAGS8726. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 27-ANG-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a new bicistronic retroviral vector. These are used for (over) expression of proteins, suppressing expression of fnon-) viral RNA and/or proteins by the antisense technique, e.g. to suppress a dominant-negative phenotype, also infectious viral particles that contain the vectors, in gene therapy, particularly for control of guest versus host disease, especially where haematopoietic cells are transduced with the vector or where T cells are transduced, for adoptive immunotherapy, but also for treating severe combined immune deficiency syndrome and for expression cloning of genes. The present sequence is a vector sequence fragment shown in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bicistronic retroviral vector, useful in gene therapy, particularly of graft versus host disease, contains components of both murine embryonic stem cell and myeloproliferative sarcoma viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 immunosuppressive; gene therapy; vector; bicistronic retroviral vector; severe combined immune deficiency syndrome; protein expression;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides a new isolated or recombinant virus called Prima7 (which belong to enteroviral species) comprising a nucleic acid sequence or its functional part, derivative or analogue of the said virus. The invention is useful for detecting and/or identifying a Prima7 enterovirus in a sample and for diagnosing an enteroviral genus related disease. The vaccine or medicament prepared from the Prima7 virus is useful for preventing and/or treating a Prima7-related disease. The invention is also useful in gene therapy. The present sequence is Prima7 virus 5. UTR region DNA.
                                                               Enteroviral genus related disease; Prima7-related disease; gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                       capable of specifically binding the virus in a sample, and as a vaccine or medicament for treating or preventing Prima7-related disease.

THE SECTION OF THE SE

```
The present invention relates to a nucleic acid vector for the expression of at least two cistrons. The vector comprises a promoter operably linked to a nucleotide sequence comprising at least two cistrons and at least cone nucleotide sequence comprising at least two cistrons and at least cone nucleotide sequence comprising an internal ribosome entry site (IRES) selected from Human enterovirus 71 (EV71), Hepatitis C virus (HCV), or Encephalomyocarditis virus (EMCV). The invention also provides a method to screening of anti-viral compounds using the IRES. The invention is useful for the genetic treatment of patients with cystic fibrosis, hemophilia A or B, Duchenne or Becker type myopathy, cancer, AIDS and other bacterial or infectious diseases due to a pathogenic organism and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid vector for the expression of at least two cistrons comprising a nucleotide sequence comprising an internal ribosome entry site (IRES) e.g. enterovirus 71 (EV71), useful for treating a patient having e.g. AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SARS-coronavirus virus-like particle; SARS-COV-VLP; cellular immune response; humozal immune response; vaccine; immunogenicity; cytotoxic T-lymphocyte; internal ribosomal entry site;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The present invention provides a system for making SARS-coronavirus virus -like particles (SARS-COV-VLPs) comprising one or more recombinant vectors that expresses the SARS-COV E (small membrane)-protein, SARS-COV M (membrane)-protein and SARS-COV E (spike)-protein. The invention is useful for inducing cellular and/or humoral immune response. The invention is also useful to reduce the symptoms of SARS-COV infections and in vaccine preparations. The present sequence is Poliovirus type I strain mahoney internal ribosomal entry site (IRES) conva. This convacence is used in the preparation of plasmid for the expression of SARS
                                                   New system comprising one or more recombinant vectors that expresses the SARS-CoV E-protein, SARS-CoV M-protein, and SARS-CoV S-protein, useful for making SARS-coronavirus virus-like particles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 743 BP; 175 A; 185 C; 181 G; 202 T; 0 U; 0 Other;

Creating nucleic acid sequence for carrying out translation by internal ribosome entry site element and expressing nucleotide sequence of interest in eukaryotic cell, by creating a nucleic acid having adeninerich block.

Disclosure; Fig 3; 48pp; English.

The present sequence is that of a known internal ribosome entry site (IRES) element contained in the 5' untranslated region of poliovirus mRNA. The invention provides a method of creating an artificial IRES element having an adenine-rich (40-100 mol\*) nucleic acid block of at

```
The invention relates to the production of platelet-derived growth factor (PDGF) comprising a transgenic mammal whose somatic and germ cells comprising a transgenic mammal whose somatic and germ cells comprise a nucleic acid sequence (I) encoding PDGF, operably linked to a promoter directing expression into mammalian gland epithelial cells, and obtaining the milk from the transgenic mammal where at least 30% of the PDGF in the milk is as a dimer. Also described is a method of producing a transgenic mammal cappable of expressing an active PDGF molecule in milk. Pharmaceutical compositions can be obtained from this milk and can be transgenic pode to enhance the wound healing process, in particular diabetic foot ulcers, decubitus ulcers and venous stasis ulcers.

Transgenic PDGF (II) can also be used in the treatment of periodontal regeneration, stimulation of bone formation, ophthalmic diseases or healing of prosthetic vascular grafts. (II) can also be used for nonmedical applications, e.g., as a supplement for cell culture media or as a component of diagnostic kits. The present sequence represents the platelet-derived growth factor expression cassette insert used in pBC701 vector of the invention
                                                                                                                                                                                                                                                         ô
least 25 nucleotides and capable of causing cap-independent translation of a downstream nucleotide sequence of interest in eukaryotic cells, such as plant, animal or yeast cells (claimed). A method of identifying nucleic acid elements having IRES activity involving genome database searches is also provided. The methods allow the creation or identification of IRES elements that are universal with cross-kingdom and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Platelet-derived growth factor expression cassette insert used in pBC701.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Platelet-derived growth factor; PDGF; transgenic; milk; gene; devoud healing; diabetic foot ulcer; decubitus ulcer; ophthalmic disease; venous stasis ulcer; periodontal regeneration; bone formation; prosthetic vascular graft; pBC701; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  profein, containing a segment from a heptad repeat region, a flexible transmembrane and an an a flexible linker (Minge) in a type I membrane protein and a flexible linker (hinge) linking Fl and MSD, therefore the formula of (I) is SP-FI-hinge-MSD. The products of the invention have antiviral activity and act as HIV replication inhibitors. Vectors containing (I), also I lymphocytes or hematopoietic stem cells transfected in vitro with (I), are used in gene therapy of HIV infection. (Updated on 11-SEP-2003 to standardise OS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel nucleic acid (I) comprising elements that encode a signal peptide (SP) that provides transfer of expressed polypeptide into the endoplasmic reticulum, a fragment (FI) of HIV gp41
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid encoding membrane-anchored gp41 fusion protein, useful for gene therapy of human immunodeficiency virus (HIV) infection,

Viral vector that expresses single-chain interleukin-12 and costimulator, useful for treatment of tumors, viral infections, e.g. human immunodeficiency virus, and prion diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a viral vector that includes a nucleic acid encoding a single-chain interleukin-12 (In-12) and a co-stimulatory protein. Viral vectors and virus particles derived from them are useful for treatment of tumours, infectious diseases (e.g. HIV, hepatitis A, B or C, cytomegalovirus or human papilloma virus), or prion diseases. The present sequence is a tricistronic expression cassette used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      immunosuppressive; gene therapy; vector; bicistronic retroviral vector; severe combined immune deficiency syndrome; protein expression;

Bicistronic retroviral vector, useful in gene therapy, particularly of graft versus host disease, contains components of both murine embryonic stem cell and myeloproliferative sarcoma viruses.
                              immunosuppressive; gene therapy; vector; bicistronic retroviral vector; severe combined immune deficiency syndrome; protein expression;
Novel bicistronic retroviral vector related vector #3.
                                                                                                                                                                                                                                                                                 product= "HSV-TK splice variant"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a new bicistronic retroviral vector. These are used for (over) expression of proteins, suppressing expression of fnon-) viral RNA and/or proteins by the antisense technique, e.g. to suppress a dominant-negative phenotype, also infectious viral particles that contain the vectors, in gene therapy, particularly for control of guest versus host disease, especially where haematopoietic cells are transduced with the vector or where T cells are transduced, for adoptive immunotherapy, but also for treating severe combined immune deficiency syndrome and for expression cloning of genes. The present sequence is a vector sequence shown in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bicistronic retroviral vector, useful in gene therapy, particularly of graft versus host disease, contains components of both murine embryonic stem cell and myeloproliferative sarcoma viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The present invention relates to a new bicistronic retroviral vector. These are used for (over) expression of proteins, suppressing expression of finon-) viral RNA and/or proteins by the antisense technique, e.g. to suppress a dominant-negative phenotype, also infectious viral particles that contain the vectors, in gene therapy, particularly for control of guest versus host disease, especially where haematopoietic cells are transduced with the vector or where T cells are transduced with the vector or where T cells are transduced, for adoptive immunotherapy, but also for treating severe combined immune deficiency syndrome and for expression cloning of genes. The present sequence is a vector sequence shown in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Synthetic. Unidentified.

Location/Qualifiers

```
The present invention relates to a new bicistronic retroviral vector. These are used for (over) expression of proteins, suppressing expression of fnon-) viral RNA and/or proteins by the antisense technique, e.g. to suppress a dominant-negative phenotype, also infectious viral particles that contain the vectors, in gene therapy, particularly for control of guest versus host disease, especially where haematopoietic cells are transduced with the vector or where T cells are transduced, for adoptive immunotherapy, but also for treating severe combined immune deficiency syndrome and for expression cloning of genes. The present sequence is a vector sequence shown in the exemplification of the invention.
                                                                                                                                                     immunosuppressive; gene therapy; vector; bicistronic retroviral vector; severe combined immune deficiency syndrome; protein expression;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      particularly of

These are used for (over) expression of proteins, suppressing expression of (non-) viral RNA and/or proteins by the antisense technique, e.g. to suppress a dominant-negative phenotype, also infectious viral particles that contain the vectors, in gene therapy, particularly for control of guest versus host disease, especially where haematopoietic cells are transduced with the vector or where T cells are transduced, for adoptive immunotherapy, but also for traating severe combined immune deficiency syndrome and for expression cloning of genes. The present sequence is a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Bicistronic retroviral vector, useful in gene therapy, particularly of graft versus host disease, contains components of both murine embryonic stem cell and myeloproliferative sarcoma viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       syndrome and for expression cloning of genes. The present sequence is a vector sequence shown in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a new bicistronic retroviral vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 7235 BP; 1595 A; 2025 C; 1949 G; 1666 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Strathmann G;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a new bicistronic retroviral vector. These are used for (over) expression of proteins, suppressing expression of fon-) viral RNA and/or proteins by the antisense technique, e.g. to suppress a dominant-negative phenotype, also infectious viral particles that contain the vectors, in gene therapy, particularly for control of guest versus host disease, especially where haematopoietic cells are transduced with the vector or where T cells are transduced, for adoptive immunotherapy, but also for treating severe combined immune deficiency syndrome and for expression cloning of genes. The present sequence is a vector sequence shown in the exemplification of the invention.
                                                                                                                                                                                                                                   immunosuppressive; gene therapy; vector; bicistronic retroviral vector; severe combined immune deficiency syndrome; protein expression;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bicistronic retroviral vector, useful in gene therapy, particularly of graft versus host disease, contains components of both murine embryonic stem cell and myeloproliferative sarcoma viruses.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a new bicistronic retroviral vector. These are used for (over) expression of proteins, suppressing expression of (non-) viral RNA and/or proteins by the antisense technique, e.g. to suppress a dominant-negative phenotype, also infectious viral particles that contain the vectors, in gene therapy, particularly for control of

The invention describes a polymerase chain reaction (PCR) and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 (CBV-4) strain VD221, (particularly VP1, VP2, VP3, VP3, P2A, P2A, P2B, P2C, P3A, P3B, P3C and P3D nucleic acids). The methods and primers are used for the detection of CBV-4 strain VD2921 which is associated with diabetes (diabetogenic enterovirus). Early detection of the diabetes e.g. detection of diabetogenic enterovirus by allowing treatment e.g. with antiviral drugs, to prevent further loss of beta cells and severe long term consequences of diabetes including blindness, renal failure and leg amputations. This sequence represents the genome of diabetogenic coxsackie B virus 4 (CBV-4) strain VD2921
                                                                                                                                                                                                                                                                                                                                                                                                                                             Polymerase chain reaction and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 strain VD2921.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Location/Qualifiers

                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                 (SDVD) gene sequence from the SVDV strain N3. SVDV is the causative agent of swine vesicular disease, which is very similar to foot and mouth disease. The invention relates to the wild-type Taiwan Yu-Li strain CDNA sequence, and the gene sequences of the mutant SVDV strains N3, H21 and SVDY. The mutant SVDV mucleotide sequence can be used in a vaccine for the prophylaxis of swine vesicular disease. The invention also includes a method for differentiating the mutant SVDV nucleotide sequences from the wild type strain of SVDV, coxsackie virus and foot-and-mouth disease is not present in the specification, but has been derived from the wild-type Taiwan Yu-Li strain SVDV gene sequence (see AAZ98717) shown on pages
                                                                                                       Mutant strains of swine vesicular disease virus (SVDV) used in vaccines to prevent swine vesicular disease.
                                                                                                                                                                                     This sequence represents the full length Swine vesicular disease virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Mutant strains of swine vesicular disease virus (SVDV) used in vaccines

to prevent swine vesicular disease.

Hwong CL,

Claim 1; Page 34-38; 66pp; English

This sequence represents the full length Swine vesicular disease virus

ö foot This sequence represents the full length Swine vesicular disease virus (SDVD) gene sequence from the SVDV strain H21. SVDV is the causative agent of swine vesicular disease, which is very similar to foot and mouth disease. The invention relates to the wild-type Taiwan Yu-Li strain CDNA sequence, and the gene sequences of the mutant SVDV strains N3, H31 and SP7. The mutant SVDV nucleotide sequence can be used in a vaccine for the prophylaxis of swine vestcular disease. The invention also includes a method for differentiating the mutant SVDV nucleotide sequences from the wild type strain of SVDV, coxeackie virus and foot-and-mouth disease virus through the use of polymerase chain reaction. Note: This sequence is not present in the specification, but has been derived from the wild-/\*tag= a /note= "Nucleotides in this position replace the wild-type nucleotide sequence of strain Taiwan Yu-Li AAZ98717" foot-andcausative agent of swine vesicular disease, which is very similar to foo and mouth disease. This sequence represents the full length Swine vesicular disease virus (SDVD) gene sequence from the SVDV strain SP7. SVDV is the causative agent of swine vesicular disease, which is very similar to foot and mouth disease. The invention relates to the wild-type Taiwan Yu-Li strain cDNA sequence, and the gene sequences of the mutant SVDV strains N3, H21 and SP7. The mutant SVDV nucleotide sequence can be used in a vaccine for the prophylaxis of swine vesicular disease. The invention also includes a method for differentiating the mutant SVDV nucleotide sequences from the wild type strain of SVDV, coxsackie virus and foot-and-mouth disease virus through the use of polymerase chain reaction. Note: This sequence is not present in the specification, but has been derived from the wild-type Taiwan Yu-Li strain SVDV gene sequence (see AAZS8717) shown on pages 34-38 of the specification
                                                                                                                                                                                                  /*tag= a
//note= "Nucleotides in this position replace the
nucleotides at position 2705-2710 of the SVDV wild-type
Taiwan Yu-Li strain (see AAZ98717)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               strains of swine vesicular disease virus (SVDV) used in vaccines

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               plasmid containing the gene; (2) preparation of the gene and its variant; and (3) a vaccine comprising the gene or its variant. The new gene is useful for the treatment of vesicular disease. The present sequence represents a specifically claimed SVDV nucleotide sequence from the
type Taiwan Yu-Li strain SVDV gene sequence (see AAZ98717) shown on pages 34-38 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a native swine vascular disease virus (SVDV) gene and its variant. Also described are: (1) an expression
                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

```
The CDNA sequence is that of a true RNA virus, i.e. the CDNA directs the produ. of a viable RNA virus which is phenotypically similar to the source virus. Viral RNA was isolated from a virus pellet obtd. from a culture of primary monkey kidney cells infected with an attenuated strain a culture of primary monkey kidney cells infected with an attenuated strain 23 poliovirus. The RNA was sequenced and compared to the published 1539-43 (1984). Two nucleotide differences were observed; at position 2493 a T in the Stanway sequence was replaced by a U(T). The viral DNA was then correct to produce a capta isolated from the synthesis of 48 control of 68 control
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence of a full-length cDNA copy of the poliovirus genome in plasmid pVRLO6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This is an attenuated poliovirus type 3 Leon strain in which the 5' non-coding region of the genome is modified by substitution with U at posn. 472, and A at posn. 537. The attenuated poliovirus may be used in a vaccine against polioviruses. They may be administered orally, as a nasal spray, or parenterally. A dose corresp. to the amt. admin. for a conventional live virus vaccine, such as up to 10power6 TCID50 for a sabin vaccine strain in the case of poliovirus may be admin. (Updated on 24-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New attenuated polio:virus for vaccines - in which 5-non-coding region of genome is 5 non-coding region of polio-virus type 3 Leon strain modified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 7431 BP; 2148 A; 1738 C; 1749 G; 1796 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                             Plasmid pVR106 was produced by combining plasmids pVR104 and pVR105. It contains a full-length cDNA copy of the poliovirus genome. E.coli HB101 contg. this plasmid has been registered as ATCC 31844. The full-length poliovirus cDNA molecule is itself infectious and can be introduced into cells and these cultured to produce RNA virus. Alternatively, the infectious cDNA can be treated with mutagens and the altered material used to infect cells so that attenuated virual RNA is prod. and this used to make vaccines. For antibody prodn., cDNA capable of directing antigen prodn. is selected and isolated and incorporated into cells which are fined.) (Updated on 27-NAA antigen. (Updated on 25-NAR-2003 to correct PA field.) (Updated on 27-NAG-2003 to correct CDN3 to standardise OS field)

The invention relates to a replication-competent recombinant Sabin type I poliovirus vector encoding a multiple cloning site and 3C-protease cleavage site between the two end N-terminal residues. This comprises a vector containing an exogenous vaccine gene at the multiple cloning site. A method of production of both vectors is also provided. The recombinant vectors are useful for developing various mucosal vaccines against a number of infectious diseases, including human immunodeficiency virus type I (HIV-I) (which causes acquired immunodeficiency syndrome (AIDS)), small pox, poliomyelitis and Hepatitis C. The poliovirus-mediated mucosal vaccine vectors overcome the disadvantages exhibited by Mahoney vectors by being safe to humans, replicable (having equal replication ability to that of the wild type) vectors, where the introduced vaccine genes are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a new bicistronic retroviral vector. These are used for (over) expression of proteins, suppressing expression of fono-) viral RNA and/or proteins by the antiseans technique, e.g. to suppress a dominant-negative phenotype, also infectious viral particles that contain the vectors, in gene therapy, particularly for control of guest versus host disease, especially where haematopoietic cells are transduced with the vector or where T cells are transduced with the vector or where T cells are transduced, for adoptive immunotherapy, but also for treating severe combined immune deficiency syndrome and for expression cloning of genes. The present sequence is a vector sequence shown in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bicistronic retroviral vector, useful in gene therapy, particularly of graft versus host disease, contains components of both murine embryonic stem cell and myeloproliferative sarcoma viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 7925 BP; 1714 A; 2242 C; 2135 G; 1834 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The specification describes a recombinant gene expression vector, which comprises a promoter sequence; a gene of interest encoding betagalactosidaes, a TGA translational stop signal, and translationally linked to the gene of interest a selectable marker gene encoding broducing a host cell clone expression vector is useful for also useful for the selection of transformed host cells that express a sene of interest. The vector is also useful for the selection of transformed host cells that express a gene of interest. The present sequence represents pGFPetcopneo. It was used during construction of vectors of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                      New recombinant gene expression vector, useful for producing a host cell clone highly expressing a gene of interest, comprises a promoter sequence, gene of interest, translational stop signal and a selectable

The TNF alpha sequence can be substituted by the IL-2 sequence. The hmAb425 has specificity for the human EGF receptor. The vector also contains a strong promoter/enhancer unit, a selection marker gene and at least two promoter/enhancer unit, a selection marker gene and at least two poliovitrus derived internal ribosomal entry site (IRES) sequences. The vector can be expressed in mammalian host cells for the production of heteromeric fusion proteins. This expression system is claimed to produce the heteromeric proteins in high yields
                                                                                                                                                                                                                                                                                                                                     note= "Poliovirus derived internal ribosome entry site"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a new pMCLDHAP tricistronic vector for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

```

```
The invention relates to a retroviral vector genome (G1) comprising two or more NOIs (nucleotide sites of interest), operably linked by one or more Internal Ribosome Entry Site(s) (IRES). Also included are a vector system (S1) comprising (G1), production (M1) of a lentiviral particle, a viral particle (P1) produced by (M1) or by (S1), a pharmaceutical composition comprising (G1), (S1) or (P1), a bicistronic cassette comprising a nucleotide sequence which encodes (T-cyclohydrolase 1 operably linked by one or more IRES(s); or D) Aromatic Amino Acid Dopa Decarboxylase and a nucleotide sequence which encodes Vesicular Monoamine Transporter 2 operably linked by one or more IRES(s); a tricistronic cassette comprising a nucleotide sequence which encodes tyrosine hydroxylase, a nucleotide sequence that encodes GTP-cyclohydrolase 1 and conditions and a nucleotide sequence that encodes GTP-cyclohydrolase 1 and cassette comprising a nucleotide sequence that encodes GTP-cyclohydrolase 1 and conditions and a nucleotide sequence that encodes GTP-cyclohydrolase 1 and conditions and a nucleotide sequence which encodes GTP-cyclohydrolase 1 and conditions and a nucleotide sequence which encodes GTP-cyclohydrolase 1 and conditions and a nucleotide sequence which encodes GTP-cyclohydrolase 1 and conditions and a nucleotide sequence which encodes GTP-cyclohydrolase 1 and conditions and a nucleotide sequence which encodes GTP-cyclohydrolase 1 and conditions and a nucleotide sequence which encodes GTP-cyclohydrolase 1 and conditions and a nucleotide sequence which encodes GTP-cyclohydrolase 1 and conditions and a nucleotide sequence which encodes GTP-cyclohydrolase 1 and conditions and a nucleotide sequence which encodes GTP-cyclohydrolase 1 and conditions and a nucleotide sequence which encodes GTP-cyclohydrolase 1 and conditions and a nucleotide sequence which encodes GTP-cyclohydrolase 1 and conditions and a nucleotide sequence which encodes GTP-cyclohydrolase 1 and conditions and conditions and conditions and conditions and condi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Decarboxylase, operably linked by one or more IRES(s) and a cell that has been transduced with (S1). G1, the vector system (S1), and the viral particle (P1) can all be used to treat and/or prevent (by gene therapy) a neurodegenerative disease, especially Parkinson's disease in a subject, and also in the manufacture of a pharmaceutical composition to treat the above mentioned disease. Treatment with vectors capable of delivering e.g., Tyrosine hydroxylase, GTP-cyclohydrolase 1, Aromatic Amino Acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Dopa Decarboxylase and Vesicular Monoamine Transporter 2, are useful for the last stages of treatment for sufferers of Parkinson's disease where they do not respond significantly to L-dopa treatment by prior art methodologies. The present sequence is retroviral vector of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Viral vector that expresses single-chain interleukin-12 and costimulator, useful for treatment of tumors, viral infections, e.g. human immunodeficiency virus, and prion diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a viral vector that includes a nucleic acid encoding a single-chain interleukin-12 (IL-12) and a co-stimulatory protein. Viral vectors and virus particles derived from them are useful for treatment of tumours, infectious diseases (e.g. HIV, hepatitis A, B or C, cytomegalovirus or human papilloma virus), or prion diseases. The present sequence is a viral vector shuttle sequence used in the
                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Jang
                                                                                                                                                                                                                                                                   RESULT 93
                                                                                                                                                                                                                                                                                                                                                                         ద
                                                                                                                                 ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a retroviral vector genome (G1) comprising two or more NOIs (nucleotide sites of interest), operably linked by one or more Internal Ribosome Entry Site(s) (IRES). Also included are a vector system (S1) comprising (G1), produced by (M1) of a lantiviral particle, a composition comprising (G1), produced by (M1) or by (S1), a pharmaceutical comprising a nucleotide sequence which encodes 1 tyrosine hydroxylase and a nucleotide sequence which encodes 1 tyrosine hydroxylase comprising a nucleotide sequence which encodes Vesicular Monoamine CC ansporter 2 operably linked by one or more IRES(s), a tricistronic cassette comprising a nucleotide sequence which encodes tyrosine C ansporter 2 operably linked by one or more IRES(s), a tricistronic cassette comprising a nucleotide sequence which encodes tyrosine C Transporter 2 operably linked by one or more IRES(s), a tricistronic cassette comprising a nucleotide sequence which encodes (TP-cyclohydrolase 1 and a nucleotide sequence that encodes GTP-cyclohydrolase 1 and a nucleotide sequence which encodes Mromatic Amino Acid Dopa pertopy and the viral pertopy and the viral particle (P1) can all be used to treat and/or prevent (by gene therapy) a couract of special part of the vector system (S1), and the viral particle (P1) can all be used to treat and/or prevent (by gene therapy) and also in the manufacture of a pharmaceutical composition to treat the above mentioned disease, respecially Parkinson's disease in a subject, and also in the manufacture of a pharmaceutical composition decomposition to treat the above mentioned disease. Treatment with vectors capable of delivering C e.g., Tyrosine hydroxylase, GTP-cyclohydrolase 1, Aromatic Amino Acid C bopa Decarboxylase and Vesicular Monoamine Transporter 2, are useful for that has targed sof treatment for sufference of paramaceutical capable of delayers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    they do not respond significantly to L-dopa treatment by prior art methodologies. The present sequence is retroviral vector of the invention, pONYB-TRIC comprising elements of the BIAV (Equine infectious banemia virus) genome, human cytomegalovirus sequences, a plasmid backbone, a green fluorescent protein sequence and the tricistronic cassette. (Updated on 07-AUG-2003 to correct OS field.)

The present chimeric sequence comprises of a Hepatitis C Virus (HCV)

protease NS3 gene and its target site NS5A/5B gene inserted into the open
creading frame of the poliovirus gene. HCV is the major etiologic agent of
non-A, non-B hepatitis, and has been implicated in liver cirrhosis and
hepatocellular carcinoma. The invention provides a hepatitis C surrogate
virus comprising of the recombinant gene described. Upon expression, the
HCV NS3 protease would cleave its target site to become independent of
the poliovirus polyprotein. HCV NS3 protease contained within the
surrogate is a good therapeutic target molecule for the development of
cuti-HCV drugs, since its activity is considered essential for viral
proliferation. The surrogate virus is claimed to be useful than the
existing in vitro systems for HCV culture for screening anti-HCV drugs
cand testing for their efficacy. It is also considered to be useful for
studying HCV genes in viral replication. (Updated on 17-OCT-2003 to

Viral vector that expresses single-chain interleukin-12 and costimulator, useful for treatment of tumors, viral infections, e.g. human immunodeficiency virus, and prion diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a viral vector that includes a nucleic acid encoding a single-chain interleukin-12 (IL-12) and a co-stimulatory protein. Viral vectors and virus particles derived from them are useful for treatment of tumours, infectious diseases (e.g. HIV, hepatitis A, B or C, cytomegalovirus or human papilloma virus), or prion diseases. The present sequence is a viral vector used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    expression; gene polymorphism; cross-species hybridisation; probe;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Collection of at least four nucleic acid probes for analysis of gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Viral vector that expresses single-chain interleukin-12 and costimulator, useful for treatment of tumors, viral infections, e.g. human immunodeficiency virus, and prion diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a viral vector that includes a nucleic acid encoding a single-chain interleukin-12 (IL-12) and a co-stimulatory protein. Viral vectors and virus particles derived from them are useful for treatment of tumours, infectious diseases (e.g. HIV, hepatitis A, B or C, cytomegalovirus or human papilloma virus), or prion diseases. The present sequence is a viral vector shuttle sequence used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                  The present invention relates to a collection of at least four nucleic acid probes, each including a segment, the entirety of which hybridises under low stringency conditions to at least a first gene of first species and a second gene of second species, where the hybridising probes correspond to different genes of the two species and the genes are orthologous to each other. The invention is useful for analysis of gene expression and of gene polymorphisms. The probes are designed for cross-species hybridiaation, e.g. by identification of conserved segments among orthologous genes. The present sequence is Picornaviridae DNA 5'-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Trans-species nucleic acid probe - for a probe collection having at least four nucleic acid probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a collection of at least four nucleic acid probes comprising a segment able to hybridize to orthologous genes from at least two different species. In the embodiments of the invention, the probe segment is at least 60% identical to orthologous genes from two different species. The present sequence represents a degenerate probe used to detect 5' untranslated region (5'UTR) sequences from viruses of the Picornaviridae family.
expression and of gene polymorphisms, comprises each probe including segment and entirety of which hybridizes under low stringency conditions to genes of two species.
                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention provides a method and a kit for detecting and differentiating an enterovirus type 71 (BV71) in a sample. The method differentiating an enterovirus type 71 (BV71) in a sample. The method form an amplificating nucleic acids in the sample with a pair of primers to form an amplification product; contacting the amplification product with at least one synthetic nucleotide sequence fixed on a solid substrate and detecting hybridisation. The present sequence is a probe used to detect New kit comprising a pair of oligonucleotide primers for nucleic acid amplification, useful in detecting and differentiating an enterovirus in detecting hybridisation. The present sequence is a probe and differentiate enterovirus type 71 (EV71) in a sample. Sequence 28 BP; 2 A; 4 C; 6 G; 15 T; 0 U; 1 Other; Wang Claim 1; SEQ ID NO 11; 14pp; English. CAPITAL BIOCHIP CO LTD UNIV QINGHUA. (UYQI)

Tao S, Cheng J;

This invention describes a novel chip used to detect a coronavirus causing the severe actue respiratory syndrome (SARS-CoV) and a non-SARS-COV infectious organism. The chip comprises an oligonucleotide probe complementary to a nucleotide sequence of SARS-COV or non-SARS-COV coronary and a non-SARS-COV or infectious organism. The chip comprises an oligonucleotide probe complementary to a nucleotide sequence of SARS-COV or non-SARS-COV or non-sequence is a gene encoding the spike glycoprocein. the small envelope containing SARS-COV a non-SARS-COV infectious organism. The detection inmobilization reaction when a sample containing or subjected of containing SARS-COV a non-SARS-COV infectious organism. The detection infellodes multiplex PCR using primers which amplify nucleotide equences from an influenza A and B virus, a human metapneumovirus, human containing sample containing sample ontaining sample or the SARS-COV is detected of containing dense of the SARS-COV, a positive hybridization signal using the negative control probe. Detecting a positive hybridization signal using the negative control probe. Detecting a positive hybridization signal using the negative control probe. Detecting sample of the SARS-COV indicates mutation of signal using the spike glycoprotein gene of the SARS-COV indicates mutation of signal using the positive control probe. Detecting sample signal using the spike glycoprotein gene of the SARS-COV indicates mutation of signal using the spike glycoprotein gene of the SARS-COV indicates mutation of signal using the spike glycoprotein gene of the SARS-COV indicates mutation of signal using the spike glycoprotein gene of the SARS-COV indicate is infected by SARS-COV and/or a non-SARS-COV infectious organism causing SARS-like symptoms. This sequence represents a probe used in the method coronavirus, canine coronavirus, feline coronavirus, porcine epidemic diarrhea virus, porcine transmissible gastroenteritis virus, bovine coronavirus, feline infectious peritonitis virus, rat coronavirus, neonatal calf diarrhea coronavirus, porcine hemagglutinating encephalomyelitis virus, puffinosis virus, turkey coronavirus or a sialodacryoadenitis virus of rat. The methods and compositions of the invention are useful in amplifying and detecting SARS-CoV nucleotide sequences, in particular for diagnosing early-stage SARS patients (infected less than one to three days) and determining whether a subject New chip for assaying for a coronavirus causing the severe acute respiratory syndrome (SARS-CoV) and a non-SARS-CoV infectious organism comprising a support and oligonucleotide probes. nfected less than one to three days) and determining whe infected by SARS-CoV and/or a non-SARS-CoV infectious Disclosure; Page 34; 122pp; English of the invention.

Bulk tissue was collected from a whole adult individual
from the Tuebingen strain. 1st strand cDNA was primed with
a Not I - oligo(dT) primer, double-stranded cDNA was
cloned into the Not I and EcoRV sites of pExpress-1.
Library was size-selected for >1 kb fragments and
normalized. A non-normalized version of this library is
also available (NIH ZGC 10). Library was constructed by
Open Biosystems (Huntsville, AL)"
